Mobile Banking Vale: Design Report

Overview

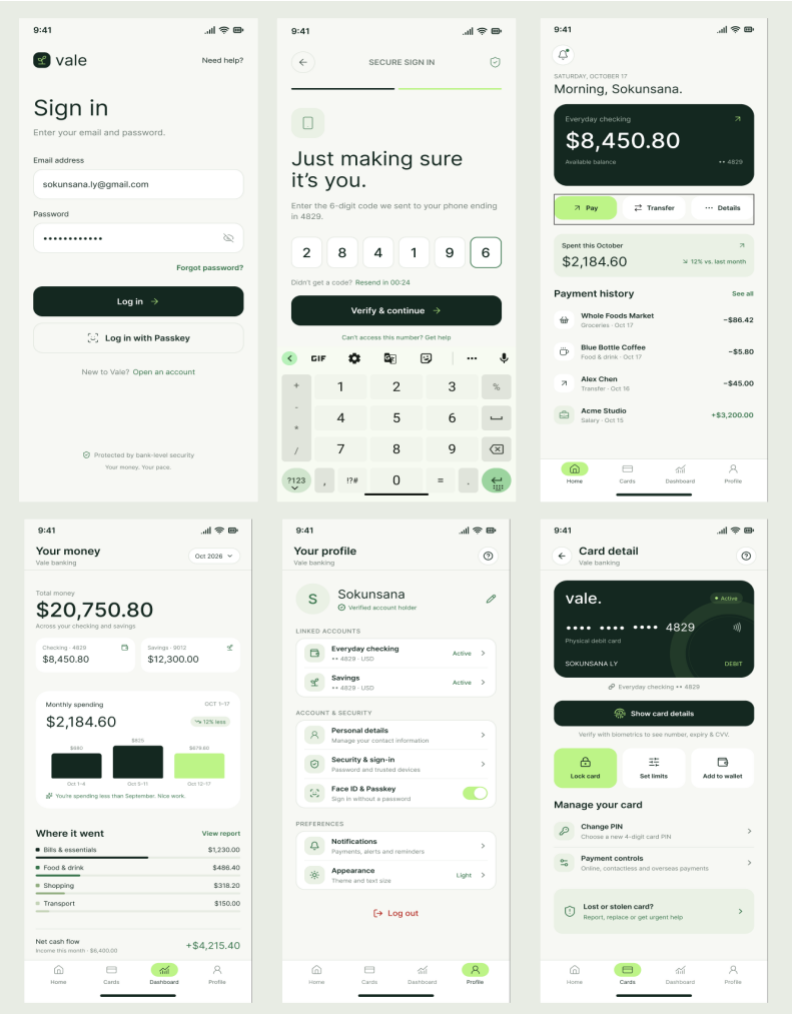

Vale is a mobile banking app prototype designed in Figma as a practice assignment. It has six screens covering sign-in, two-step verification, the home screen, a spending dashboard, the user's profile and card management. The design aims to feel calm and trustworthy, so money amounts are always the most prominent thing on screen.

Screens

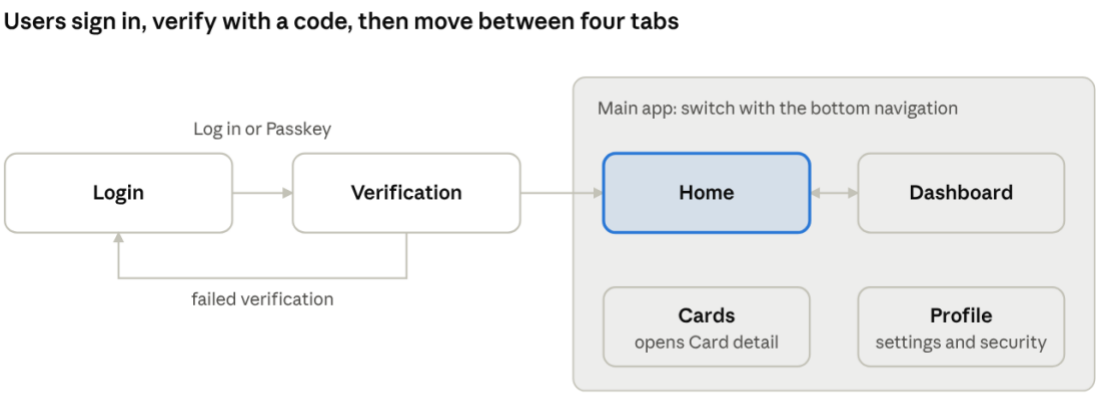

The six screens share one visual language: cream backgrounds, dark green surfaces and a lime accent for the main action or active state.

Screen	Purpose	Key elements
Login	Get the user into their account quickly and safely	Email and password fields, show/hide password, Forgot password, Log in, Log in with Passkey, Open an account, security note
Verification	Confirm it's really the user with a one-time code	Two-step progress bar, 6 code boxes, resend countdown, Verify & continue, number keyboard, help link
Home	Show everyday money at a glance and the main actions	Greeting, checking balance card, Pay / Transfer / Details, monthly spending card, payment history, bottom navigation
Dashboard	Explain where the money went this month	Total money, account cards, weekly spending chart, spending by category, net cash flow, month filter
Profile	Manage the person, their accounts and settings, with no money amounts	Avatar and verified badge, Linked accounts list, Account & security group with Face ID toggle, Preferences, Log out
Card detail	Control the debit card safely from the Cards tab	Card visual with Active status, Show card details (biometric), Lock card / Set limits / Add to wallet, Change PIN, Payment controls, Lost or stolen card help

User flow

Sign-in is a straight two-step path, and after it the user moves freely between tabs with the bottom navigation.

User flow · 6 screens, 4 tabs

The back arrow on Verification returns to Login. Home is highlighted because it is where every session lands.

UI design

The UI uses a small green palette, one typeface and a clear size ramp. Big numbers carry the screen, and quiet greys support them.

Colour palette

Role	Hex	Where it appears
Primary dark green	#142820	Main buttons, balance card, headings, active text (the most-used colour, on 63 layers)
Background cream	#F7F8F4	Screen backgrounds
Surface white	#FFFFFF	Input fields, account cards, chart card, icon tiles
Soft green surface	#F1F5EC / #EAF1E5	Spending card, icon backgrounds, secondary buttons
Accent lime	#BDF487	Pay button, active nav pill, current-week bar, progress step
Success green	#36734A	Links (Forgot password, See all), positive amounts, the active code box
Secondary text	#738078	Subtitles, dates, labels
Body text	#181D18	Primary text on light backgrounds
Border	#DFE5DD	Field and card outlines

UX design

Each screen answers one question for the user, and the main action is always the strongest element on it. The numbers are consistent across screens: the categories and weekly bars both add up to $2,184.60, and income minus spending gives the +$4,215.40 net cash flow. That consistency builds trust in a banking app.

Screen	Key UX decisions	Why
Login	Labels above fields, show/hide password, Forgot password under the field, Passkey as a secondary button, security footer	Fewer typing errors, easy recovery, reassurance at the moment of trust
Verification	Step 2 of 2 progress, masked phone number, 6 code boxes, resend countdown, number keyboard	Users know where they are and where the code went, and only digits are needed

Screen	Key UX decisions	Why
Home	Balance as the largest text, Pay / Transfer / Details, scannable payment rows	The key number comes first and common tasks are one tap away
Dashboard	Summary-to-detail order, value labels on bars, positive insight, month filter	Readable at a glance, and it encourages good habits
Profile	No balances, grouped settings, Face ID toggle, Log out set apart in red	One job per tab; settings are quick to scan and safe to use
Card detail	Number hidden behind biometrics, Lock card as the primary action, separate lost-card panel	Sensitive data stays protected and urgent actions are easy to find
All tabs	Bottom navigation with a lime pill on the active tab	Familiar pattern, and the current location is obvious

Lesson applied: Android App UI/UX

Vale already follows most of the lesson's UI and UX principles. The main gaps are full Android/Material 3 alignment, the 8dp grid and the feedback states.

Lesson topic	Applied in Vale
Material 3	Bottom bar follows the M3 NavigationBar, with a pill behind the active icon; filled, outlined and text buttons; an M3 keyboard on Verification
Layout & spacing	Auto layout on every screen; 24 margins on most screens
Colour theory	Analogous green palette for a calm, unified look; red as the complementary accent for alerts and Log out
Accessibility	Debits and credits use a sign as well as colour; labels sit above fields
User research & flow	Built around three tasks: check money, move money, control the card; sign-in flow mapped
Navigation	Four-tab bottom nav; back arrow only on detail screens; consistent top bar
Interactions & feedback	Show/hide password, resend countdown, Active status, Face ID toggle
Performance	Short, focused screens with no extra steps
Testing	Task-based layout ready to test
Animation	None yet
